## Praktikum Jaringan Komputer Modul 3

### Kelompok B18

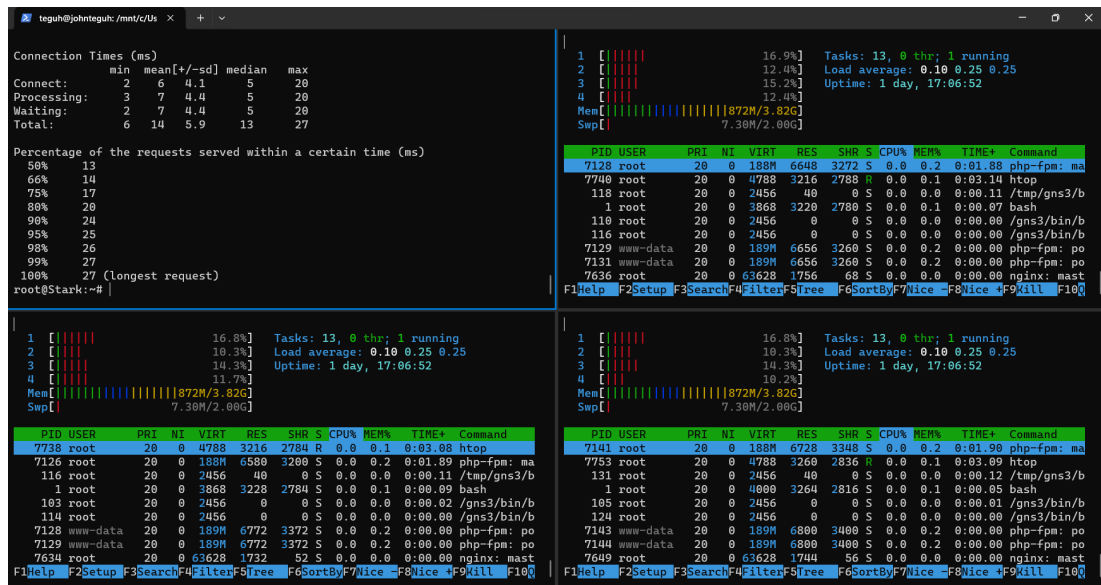

#### Anggota:

1. Shazia Ingeyla Naveeda (5025211203)
2. Aryan Shafa Wardana (5025211031)

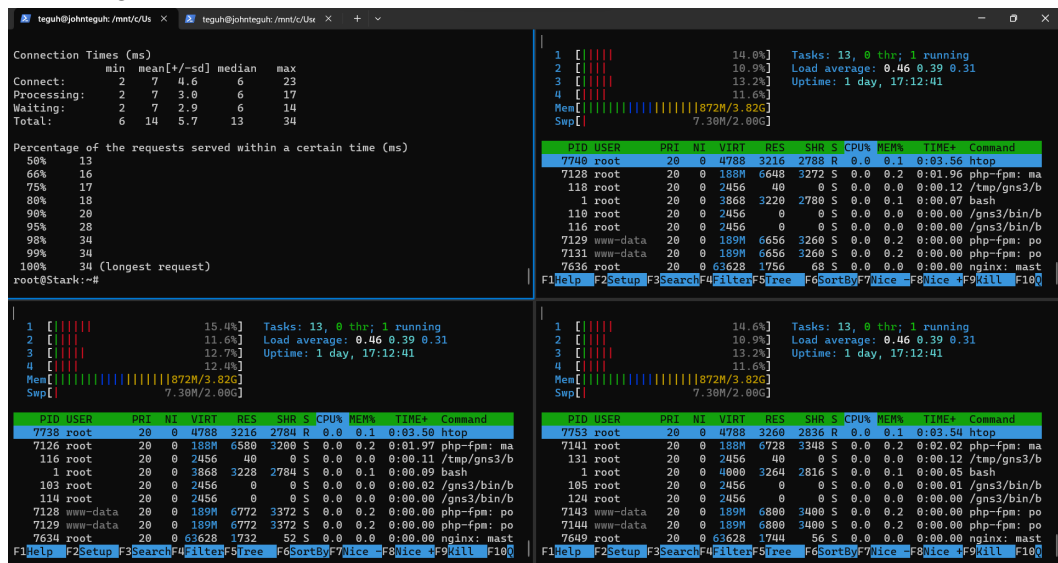

#### I. Hasil Testing

##### Nomor 8

##### A. Algo Round Robin ( 691.12 [#sec] (mean) )

##### B. Algo Least Connection ( 635.47 [#sec] (mean) )

### C. Algo IP Hash ( 684.04 [#/sec] (mean) )

The screenshot displays a terminal window with two main sections. The left section shows connection times and a percentage of requests served within a certain time. The right section shows system status and a list of running processes.

**Connection Times (ms)**

	min	mean[+/-sd]	median	max
Connect:	2	6 3.2	5	18
Processing:	2	7 3.4	7	20
Waiting:	2	7 3.3	7	20
Total:	6	13 4.4	13	32

**Percentage of the requests served within a certain time (ms)**

Time (ms)	Percentage
50%	13
66%	14
75%	16
80%	17
90%	19
95%	21
98%	23
99%	23
100%	32 (longest request)

**System Status**

Tasks: 13, 0 thr; 1 running  
Load average: 0.47 0.40 0.32  
Uptime: 1 day, 17:16:18

## Nomor 9

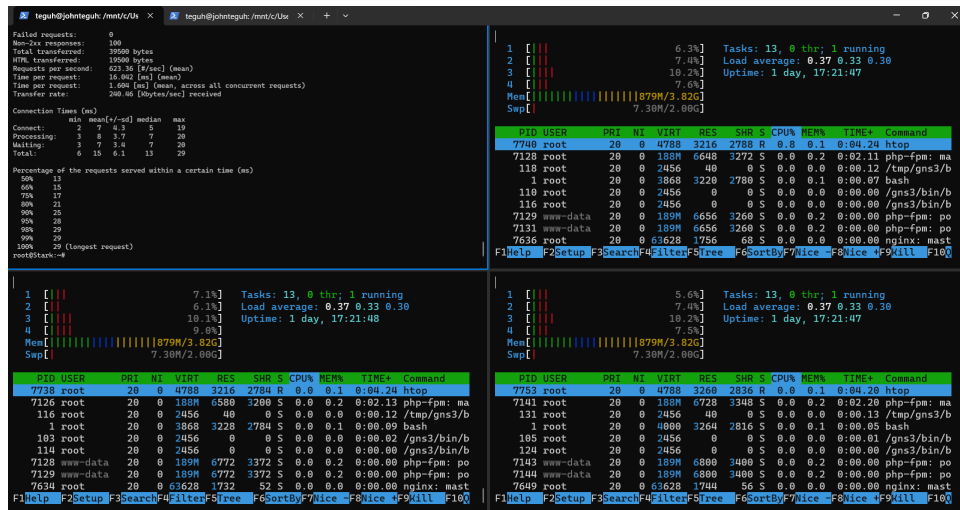

### A. Algo Round Robin 3 Worker

### B. Algo Round Robin 2 Worker

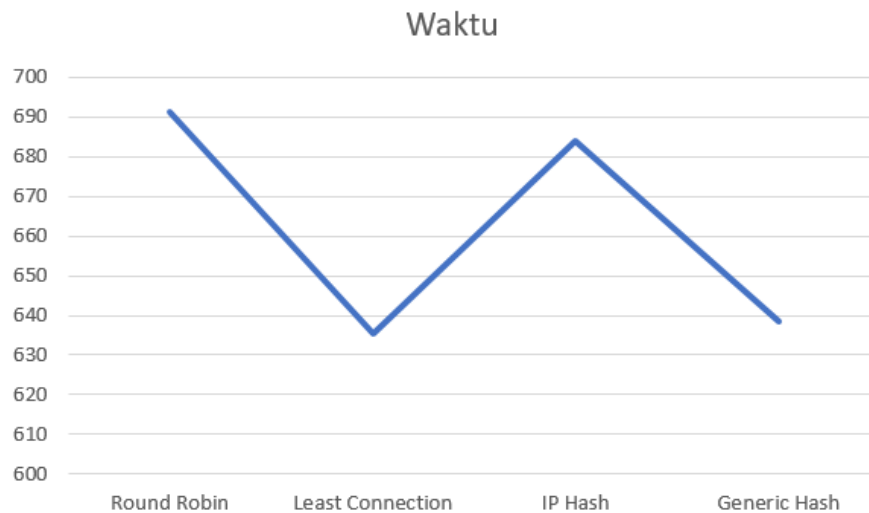

### C. Algo Round Robin 1 Worker

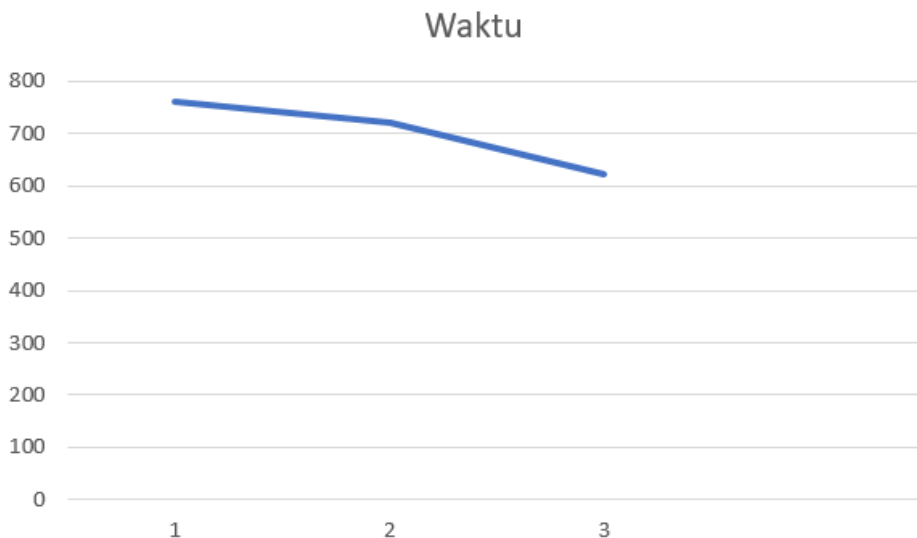

## II. Grafik

### A. Nomor 8

### B. Nomor 9

### III. Analisa

#### **Round Robin:**

Rata-rata request per second: 691.12 req/s.

Dengan Algoritma ini server akan menerima request secara bergantian. Dengan beban yang dianggap sama.

#### **Least Connection:**

Rata-rata request per second: 635.47 req/s.

Server yang memiliki koneksi terendah akan menjadi tujuan untuk request baru karena algoritma ini akan memilih server dengan jumlah koneksi yang paling rendah.

#### **IP Hash:**

Rata-rata request per second: 684.04 req/s.

Algoritma IP Hash akan melakukan distribusi request dengan IP. Dimana akan digunakan informasi alamat IP yang diinginkan klien untuk menentukan tujuan dari request tersebut

#### **Generic Hash:**

Rata-rata request per second: 638.46 req/s.

Algoritma ini menggunakan fungsi hash untuk menentukan server yang akan menerima permintaan, yang dapat memberikan seimbang beban dengan baik.

Bisa ditarik kesimpulannya bahwa algoritma yang dipakai bisa saja berbeda tingkat efisiensinya. Tergantung dengan kebutuhan karena apakah aplikasi yang dibutuhkan dinamis dan sebagainya. Maka dari itu pemilihan algoritma load balancing harus dipertimbangkan. Namun tingkat efisiensi bisa saja dipengaruhi oleh rata-rata req/sec. Semakin kecil maka akan semakin efisien.

## Nomor 15

Apache Benchmark menggunakan api POST /auth/register

```
POST /auth/register X + v

Benchmarking 192.187.2.2 (be patient).....done

Server Software:      nginx/1.14.2
Server Hostname:      192.187.2.2
Server Port:          81

Document Path:        /api/auth/register
Document Length:      6619 bytes

Concurrency Level:    10
Time taken for tests:  0.953 seconds
Complete requests:    100
Failed requests:      0
Non-2xx responses:    100
Total transferred:    696500 bytes
Total body sent:      20600
HTML transferred:     661900 bytes
Requests per second:  104.90 [#/sec] (mean)
Time per request:     95.330 [ms] (mean)
Time per request:     9.533 [ms] (mean, across all concurrent requests)
Transfer rate:        713.50 [Kbytes/sec] received
                     21.10 kb/s sent
                     734.60 kb/s total

Connection Times (ms)
      min      mean[+/-sd] median   max
Connect:    0       1   2.4      0     10

```

## Analisis:

Setelah dimodifikasi konfigurasi PHP-FM dengan 3 percobaan, diperoleh bahwa Percobaan 1 memiliki requests per seconds paling besar. Sedangkan, Percobaan 2 memiliki requests per seconds paling kecil. Namun, dapat dilihat bahwa semakin besar hyperparameter maka semakin banyak request yang failed atau gagal.
